HealneX

Unified digital healthcare that connects patients, doctors, and administrators with teleconsultations, health records, payments, and engagement tools in one place.

Project Title & Tagline

- **Project:** HealneX
- **Tagline:** "Seamless healthcare access wherever patients and clinicians are."

Problem Statement

Millions of people across rural and semi-urban India still face fragmented care, disconnected medical records, opaque pricing, and distrust of digital consultations. Clinics struggle with overcrowding, manual scheduling, and a lack of follow-up infrastructure. Without an integrated, secure, and affordable telehealth ecosystem, patients experience delayed diagnoses and financial strain while providers face burnout and inefficiencies.

Solution Overview

HealneX is a unified healthtech platform that merges teleconsultation, electronic health records, secure billing, referrals, and engagement features under a single workflow. Patients can discover specialists, book and pay for visits, chat or join teleconsultations, and maintain lifelong records. Clinicians manage schedules, prescriptions, payouts, referrals, and treatment plans from role-specific dashboards. Administrators monitor platform growth with analytics, announcements, and configuration tools.

Innovation & Impact

- Integrated OTP-based onboarding, unique patient IDs, and Stripe-backed payments build trust and accountability.
- AI-assisted document analysis (LLaVA vision-language model) turns uploaded lab reports into structured clinical insights.
- Referral gamification reduces cost barriers for patients while boosting adoption.
- Modular blueprints and service helpers make the system cloud-ready and easy to extend during the hackathon timeline.

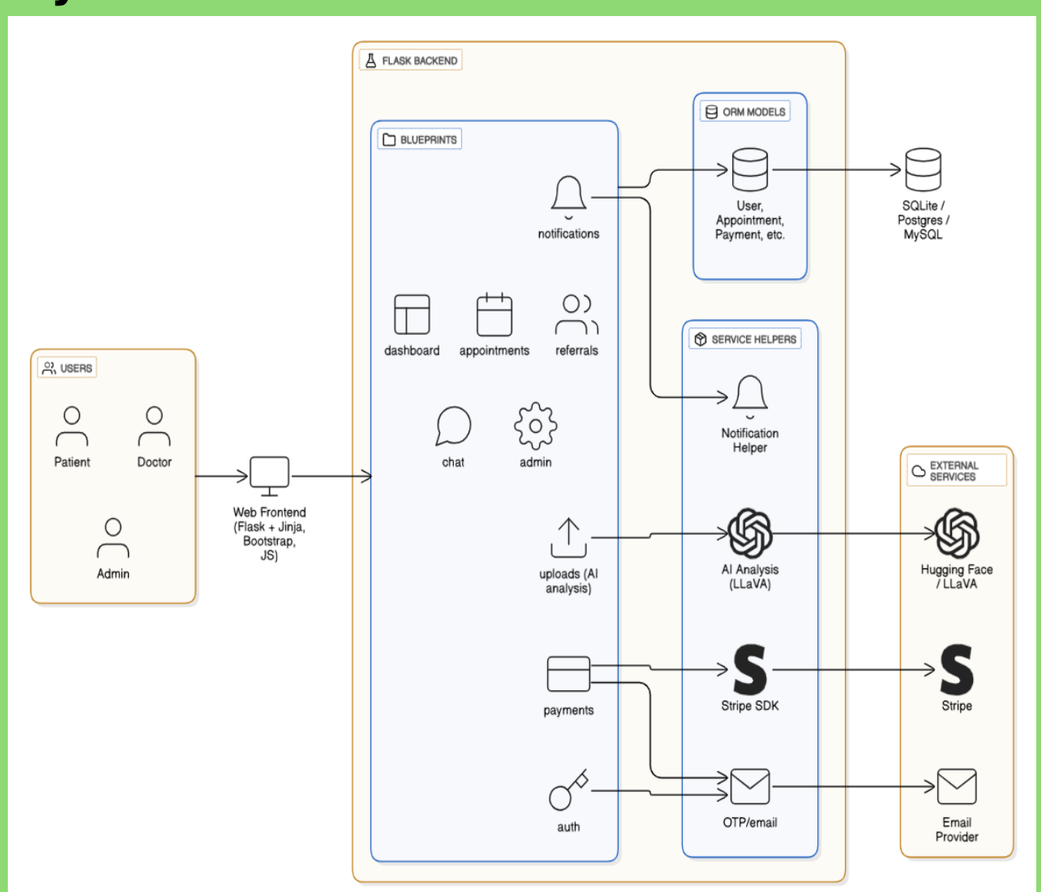
Features

- Patient, doctor, and admin role-based dashboards with tailored KPIs
- OTP-protected login, patient unique IDs, and doctor verification
- Appointment booking, rescheduling, cancellation, and completion workflows with Stripe or offline payments
- Subscription plans and referral-driven discounts for frequent users
- Secure medical file storage with quota enforcement per subscription tier
- AI-powered medical report analysis leveraging LLaVA vision-language models
- Real-time chat, video-call scaffolding, notifications, and treatment notes
- Admin suite covering user governance, revenue analytics, reports, announcements, and system settings
- Comprehensive email templates for OTP, receipts, contact support, and announcements

System Architecture & Workflow



Team

Name	Role	Contribution
Shah Ram	Backend Lead & Platform Architect	Flask services, DB schema, payments, admin analytics
Nisarg Parmar	Full Stack & AI Engineer	Frontend design, AI report analysis, telehealth UX, deployment pipelines
