Interpretation / Impression

- CBC within normal limits for the most part.
- Mild, borderline low hemoglobin (13.2 g/dL) for adult male — not clinically significant in isolation.
- Mild eosinophilia (6%) — may reflect allergic tendency (consistent with history of seasonal allergies).
- No leukocytosis to suggest a marked bacterial infection.

Clinical Summary & Recommendations

- Presentation consistent with **acute viral upper respiratory infection / seasonal viral illness** with mild systemic symptoms.
- Symptomatic treatment advised (see attached prescription).
- No immediate indication for antibiotics based on current clinical picture and CBC.
- If fever persists beyond 72 hours, cough worsens, or respiratory difficulty develops, obtain repeat evaluation and consider further tests (CRP, chest X-ray, or viral PCR as indicated).
- Repeat CBC and clinical review in **5–7 days** if symptoms persist.
